Coag Factor VIII Activity Assay, P

Result Name	Value	Unit	Reference Value	Performing Site
  Coag Factor VIII Activity Assay, P	40	%	55–200	 MCR

Mild to moderate reduction in FVIII activity may be seen in mild or moderate congenital hemophilia A (HA), a carrier state for HA, autoimmune FVIII inhibitors, congenital von Willebrand disease, acquired von Willebrand syndrome or as a normal state in individuals with blood group O. Note: Factor VIII activity in frozen-thawed plasma may be 10–20% lower than in fresh plasma, or can be even lower if specimen processing, storage, or transportation are suboptimal. If indicated, please call Mayo Clinic Laboratories at 800–533–1710 to determine if sufficient plasma specimen is available for additional 'add-on' testing.
