Alpha-Fetoprotein, Tumor Marker, S

MCF

<0.5 ng/mL

REFERENCE VALUE

<8.4

Reference values are for non-pregnant subjects only; fetal production of AFP elevates values in pregnant women.

ADDITIONAL INFORMATION

In this Beckman Coulter assay AFP concentrations are <8.4 ng/mL for 99% of a normal population consisting of non-pregnant healthy individuals, without known liver disease, hepatocellular carcinoma, or germ-cell tumors. The "persistence of alpha-

fetoprotein", an uncommon hereditary trait may cause elevations of AFP above the reference interval.

Values obtained with different assay methods or kits may be different and cannot be used interchangeably.

Test results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.

Alpha-Fetoprotein values are not interpretable in pregnant females for the investigation of malignant disease.
