ADAMTS13 Activity Assay, P

Result Name	Value	Unit	Reference Value	Performing Site
ADAMTS13 Activity	95	%	≥70	MCR

Interpretation

1 MCR

No laboratory evidence of ADAMTS13 deficiency. A normal ADAMTS13 activity level does not completely exclude a clinical diagnosis of thrombotic thrombocytopenia purpura (TTP). Recommend clinical correlation. Note: recent plasma infusion or plasma exchange may raise ADAMTS13 levels above patient's baseline. If indicated, please call Mayo Clinical Laboratories at 800-533-1710 to determine if sufficient plasma specimen is available for additional "add-on" testing (ADAMP/ADAMTS13 Act

w/Inhibitor Prof, P).

Non-specific substrate proteolysis by other plasma proteases or recent plasma transfusion or plasma exchange may falsely raise ADAMTS13 activity. Markedly elevated endogenous von Willebrand factor (VWF), hyperlipidemia, hemolysis with plasma free hemoglobin greater than 2mg/dL, hyperbilirubinemia (greater than 6mg/dL) may falsely lower ADAMTS13 activity.
