EBV Ab Profile, S

EBV VCA IgM Ab, S	Negative	Negative	MCF
EBV VCA IgG Ab, S	Negative	Negative	MCF
EBNA Ab, S	Negative	Negative	MCF
Interpretation	FRTXT		MCF

In most populations, at least 90% of the adult population will have been infected with EBV sometime in the past and therefore, will be positive for anti-VCA/IgG and anti-EBNA. Antibodies to EBNA develop 6-8 weeks after primary infection and remain present for life. Presence of VCA/IgM antibodies indicates recent primary infection with EBV.
