Cysticercus Ab (IgG), ELISA, CSF

Y038

1

High

REFERENCE RANGE: <0.75

INTERPRETIVE CRITERIA:

<0.75 Antibody Not Detected

≥ 0.75 Antibody Detected

Diagnosis of central nervous system infections can be accomplished by demonstrating the presence of intrathecally-produced specific antibody. Interpretation of results may be complicated by low antibody levels found in CSF, passive transfer of antibody from blood, and contamination via bloody taps. Antibodies to other parasitic infections, particularly echinococcosis, may crossreact in the cysticercus IgG ELISA. Confirmation of positive ELISA results by the cysticercus IgG antibody Western blot is thus recommended.
