Thyroglobulin Interpretation

Thyroglobulin (Tg) levels must be interpreted in the context of TSH levels, serial Tg measurements and radioiodine ablation status. Tg levels of ≥ 10 ng/mL in athyrotic individuals on suppressive therapy indicate a significant (>25%) risk of clinically detectable recurrent papillary/follicular thyroid cancer.

ADDITIONAL INFORMATION

PLEASE NOTE: Thyroglobulin flagging is based on athyrotic reference values.

The thyroglobulin and thyroglobulin antibody testing methods are immunoassays manufactured by Beckman Coulter Inc. and performed on the Unicel DXI 800.

Values obtained from different assay methods or kits may be different and cannot be used interchangeably.

The results cannot be interpreted as absolute evidence for the presence or absence of malignant disease.
