SAMPLE REPORT

Neonatal Alloimmune Thrombocytopenia (NAIT)

Interpretation

Results: No platelet specific alloantibodies detected in maternal serum.

Antibody Specificity: Not applicable.

Strong positive reactions detected in maternal serum against Class I HLA.

Strong positive reactivity detected in maternal serum against intact platelets indicating the presence of platelet-reactive antibodies and/or immune complexes. This reactivity is probably due to HLA antigens. Such antibodies are rarely, if ever, implicated in the pathogenesis of Neonatal Alloimmune Thrombocytopenia (NAIT).

Methodology:

The serologic results were determined using a diverse panel of tests including monoclonal antibody immobilization of glycoproteins and whole platelet flow cytometry assays. The panel is designed to identify platelet antibodies reactive with Class I HLA, as well as antigens on platelet glycoproteins Ia, IIa, IIb, IIIa, Ib/IX, and glycoprotein IV (GPIV/CD36).

This test was developed and its performance characteristics validated by BloodCenter of Wisconsin. It has not been cleared or approved by the FDA. However, the FDA has determined that such clearance or approval is not necessary. The results are not intended to be used as the sole means for clinical diagnosis or patient management decisions but should not be regarded as investigational or for research. Our laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing.
