Result Summary

MCR

Abnormal

Interpretation

MCR

The result is abnormal. Of 20 metaphases, 3 were normal and 17 were hyperdiploid, including trisomies 4, 10 and 17, and tetrasomy 21. B-ALL panel FISH studies confirmed a hyperdiploid clone (reported separately).

Hyperdiploidy is associated with a favorable prognosis in B-lymphoblastic leukemia/lymphoma (B-ALL) (Iacobucci et al., J Clin Oncol 35:975–983, 2017; Roberts et al., Nat Rev Clin Onc 12:344–357, 2015).

For monitoring response to therapy, FISH for chromosomes 4, 10, 17 and 21 is available, test BALMF (ALL (B-cell), Specified FISH).
