JAK2 V617F Mutation Detection, BM

1 MCR

Bone marrow, JAK2 V617F mutation analysis:
Negative for JAK2 V617F.

A negative JAK2 V617F test result does not exclude the possibility of a myeloproliferative neoplasm (MPN). If clinical suspicion is high for primary myelofibrosis (PMF) or essential thrombocythemia (ET), consider additional testing for CALR with reflex to MPL (test ID: MPNCM). If clinical suspicion is high for polycythemia vera, the test JAK2 Exon 12 and Other Non-V617F

Mutational Detection (test ID: JAKXB or JAKXM) could be considered. Clinicopathologic correlation is recommended for a definitive diagnosis.

Signing Pathologist: Melissa Tricker-Klar

ADDITIONAL INFORMATION

Method summary - JAK2 V617F analysis: Quantitative, allele-specific polymerase chain reaction (PCR) assay was performed using extracted genomic DNA to evaluate for the point mutation causing JAK2 V617F. The analytic sensitivity of this assay has been determined at 0.06% (see Mayo Clinic Laboratories Interpretive Handbook for method details).

Received: 08 Nov 2017 16:09
