MCR

acute myeloid leukemia. Clinicopathologic correlation is recommended for a definitive diagnosis.

JAK2 V617F Mutation Detection, BM

1 MCR

The precision of JAK2 mutation percentage measurement is such that values 2 times higher or lower than the reported value are considered equivalent.

Bone marrow, JAK2 V617F mutation analysis:

Positive. JAK2 V617F mutated DNA was detected and measured at 12% of total JAK2 DNA.

Signing Pathologist: Melissa Tricker-Klar

ADDITIONAL INFORMATION

Method summary - JAK2 V617F analysis: Quantitative, allele-specific polymerase chain reaction (PCR) assay was performed using extracted genomic DNA to evaluate for the point mutation causing JAK2 V617F. The analytic sensitivity of this assay has been determined at 0.06% (see Mayo Clinic Laboratories Interpretive Handbook for method details).

Received: 08 Nov 2017 16:10

Reported: 08 Nov 2017 17:02

JAK2 V617F mutation is found with high frequency in Philadelphia chromosome-negative myeloproliferative neoplasms (>95% in polycythemia vera and approximately 50–60% in primary myelofibrosis and essential thrombocythemia). It can also occur in other myeloid neoplasms, such as refractory anemia with ring sideroblasts associated with marked thrombocytosis (RARS-T) and rarely in myelodysplastic syndrome, chronic myelomonocytic leukemia, atypical chronic myeloid leukemia and

Laboratory Notes

- 1 This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. This test has not been cleared or approved by the U.S. Food and Drug Administration.
