HA F8 Intron 1 Inversion, AF or CVS

F81P Interpretation

1 MCR

These results do not provide evidence for a diagnosis of hemophilia A in the fetus of [MOTHER'S NAME] due to the intron 1 inversion mutation. This interpretation assumes that [MOTHER'S NAME] has previously been shown to carry the intron 1 inversion mutation in the F8 gene.

If [MOTHER'S NAME] has not been shown to be a carrier of the intron 1 inversion mutation, this result is not a true negative result. Testing of an affected or known carrier is recommended to determine the cause of hemophilia A in the family.

Errors in the information provided to us may lead to erroneous interpretation of test results.

A genetic consultation may be of benefit.

MCC Negative: Using a panel of polymorphic markers to compare maternal and fetal specimens, there was no evidence of maternal cell contamination in the fetal specimen.

ADDITIONAL INFORMATION

Genomic DNA is amplified by PCR with primers specific for the F8 intron 1 inversion mutation.

HA F8 Int1 KM Reason for Referral

MCR

Mother is a known or suspected carrier for Hemophilia A. Prenatal evaluation test for the presence of mutations in the F8 gene.

HA F8 Intron 1 Inversion, AF or CVS

MCR

Negative

Reference Value
Not applicable

An intron 1 inversion was NOT detected within the F8 gene.
