PLA2R, Immunofluorescence, S

Positive

Abn

Consistent with low level PLA2R antibodies. Sometimes seen in patients previously treated with immunosuppressive regimens.

Rarely, the IFA assay may be positive when the ELISA assay result is below the ELISA lower cutoff level. This can occur in two situations:

1. The patient may have low titer antibody, below the lower cutoff level for the ELISA assay (the IFA assay is more sensitive than the ELISA assay in detecting low levels of PLA2R antibodies). For example, this can be seen in patients whose membranous nephropathy has been treated.
2. The IFA is a false positive result.
