

Hepatosplenomegaly Panel, Blood

## Overview

#### **Useful For**

As a component of the initial evaluation of a patient presenting with hepatosplenomegaly

This test is **not useful for** the identification of carriers.

This test **should not be used** as a monitoring for patients with confirmed diagnoses.

## **Highlights**

This is a screening test for a select number of lysosomal and lipid storage disorders, including cerebrotendinous xanthomatosis, Gaucher disease, and Niemann-Pick disease types A, B (also known as acid sphingomyelinase deficiency), and C.

The above conditions may all have hepatosplenomegaly as a presenting sign, making this test a helpful component of a patient's initial evaluation.

Although Fabry disease does not have hepatosplenomegaly as a clinical symptom, it can be identified by this assay as the compound, globotriaosylsphingosine, is detected.

#### **Method Name**

Liquid Chromatography Tandem Mass Spectrometry (LC-MS/MS)

## **NY State Available**

Yes

## **Specimen**

## **Specimen Type**

Whole blood

## **Ordering Guidance**

This test **should not be used** for monitoring patients with confirmed diagnoses. If the testing requested is for monitoring purposes, see:

- -CTXWB / Cerebrotendinous Xanthomatosis, Blood
- -GPSYW / Glucopsychosine, Blood
- -OXYWB / Oxysterols, Blood

This test's clinical sensitivity and specificity for the identification of Niemann-Pick type C (NPC) is 75% and 89%, respectively. If NPC is strongly suspected, the recommended test is HSMP / Hepatosplenomegaly Panel, Plasma.

Hepatosplenomegaly Panel, Blood

Specimen Required

Collection Container/Tube: Preferred: Lavender top (EDTA)

Acceptable: Green top (sodium heparin, lithium heparin), yellow top (ACD B)

Specimen Volume: 1 mL

Collection Instructions: Send whole blood specimen in original vial. Do not aliquot.

## **Forms**

If not ordering electronically, complete, print, and send a Biochemical Genetics Test Request (T798) with the specimen.

## **Specimen Minimum Volume**

0.25 mL

## Reject Due To

Gross	ОК
hemolysis	
Gross lipemia	OK
Gross icterus	OK

## **Specimen Stability Information**

Specimen Type	Temperature	Time	Special Container
Whole blood	Refrigerated (preferred)	72 hours	
	Ambient	48 hours	

## **Clinical & Interpretive**

## **Clinical Information**

Hepatosplenomegaly is a presenting or accompanying feature for many different inborn errors of metabolism. It typically is a consequence of chronic hepatic dysfunction or abnormal storage of lipids, sugars, or other improperly metabolized analytes due to a particular enzymatic deficiency. The diagnosis can occasionally be narrowed down by consideration of clinical symptoms; however, clinical diagnosis can be difficult due to similarity of clinical features across disorders as well as phenotypic variability. Therefore, screening tests can play an important role in the workup of a patient presenting with hepatosplenomegaly who may have a lysosomal or lipid storage disorder.

The conditions detected in this assay are cerebrotendinous xanthomatosis, Gaucher disease, and Niemann-Pick (NP) disease types A, B (also known as acid sphingomyelinase deficiency), and, with a lower sensitivity and specificity, NPC.

Patients with abnormal results should have follow-up enzymatic or molecular testing for confirmation of diagnosis.

## Table. Conditions Identifiable by Method

Disorder	Onset	Analyte detected	Gene	Incidence
Cerebrotendinous	Infancy -	7-Alpha-hydroxy-4-cholest	CYP27A1	1 in 50,000

Hepatosplenomegaly Panel, Blood

xanthomatosis	adulthood	en-3-one (7aC4)		As high as 1 in 400	
(CTX)		7-Alpha,12-aplha-dihydrox		in Druze population.	
		ycholest-4-en-3-one			
		(12aC4)			
	Phenotype: Early	Phenotype: Early onset diarrhea, cataracts, tendon/cerebral xanthomas, osteoporosis,			
	neuropsychological manifestations, liver disease/hepatosplenomegaly.				
Gaucher disease	Type I:	Glucopsychosine (GPSY)	GBA	Type I:	
	childhood/adul			1 in 30,000 to 1 in	
	t			100,000	
	Types II/III:			Types II/III:	
	neonatal-early			1 in 100,000	
	childhood				
	Phenotype: All types exhibit hepatosplenomegaly and hematological abnormalities.				
	Type I: Organomegaly, thrombocytopenia, and bone pain. Absence of neurologic				
	symptoms.				
	Types II/III: Primary neurologic disease, developmental delay/regression,				
	hepatosplenomegaly, lung disease. Patients with type II typically die by 2 to 4 years of age.				
	Patients with type III may have a less progressive phenotype and may survive into				
	adulthood.

Patients with Fabry disease may also be identified by this assay. The glycosphingolipid, globotriaosylsphingosine (LGb3), may be elevated in symptomatic patients and supports a diagnosis of Fabry disease. Normal values of LGb3 do not rule out Fabry disease. Patients with Fabry disease do not have hepatosplenomegaly as an accompanying feature.

## **Reference Values**

CHOLESTANE-3-BETA,5-ALPHA,6-BETA-TRIOL

Cutoff: < or =0.800 nmol/mL

LYSO-SPHINGOMYELIN
Cutoff: < or =0.100 nmol/mL

Hepatosplenomegaly Panel, Blood

**GLUCOPSYCHOSINE** 

Cutoff: < or =0.040 nmol/mL

7-ALPHA-HYDROXY-4-CHOLESTEN-3-ONE (7aC4)

Cutoff: < or =0.750 nmol/mL

7-ALPHA,12-ALPAH-DIHYDROXYCHOLEST-4-en-3-ONE (12aC4)

Cutoff: < or =0.250 nmol/mL

GLOBOTRIAOSYLSPHINGOSINE Cutoff: < or =0.034 nmol/mL

#### Interpretation

An elevation of 7-alpha-hydroxy-4-cholesten-3-one (7aC4) and 7-alpha,12-alpha-dihydroxycholest-4-en-3-one (12aC4) is strongly suggestive of cerebrotendinous xanthomatosis.

An elevation of lyso-sphingomyelin (LSM) and LSM 509 is highly suggestive of Niemann-Pick type A or B disease.

An elevation of cholestane-3 beta, 5 alpha, 6 beta-triol and LSM 509 is highly suggestive of Niemann-Pick disease type C.

An elevation of glucopsychosine is indicative of Gaucher disease.

#### **Cautions**

Patients with Wolman disease or cholestatic biliary atresia may have a profile similar to Niemann-Pick disease type C.

Patients with bile acid malabsorption or ileal resection may have elevations of 7-alpha-hydroxy-4-cholesten-3-one (7aC4).

This test does not identify all causes of hepatosplenomegaly.

A positive test result is strongly suggestive of a diagnosis but needs follow-up by stand-alone biochemical or molecular assay.

#### **Performance**

#### **Method Description**

Whole blood is spotted on filter paper and dried overnight. A 3-mm dried blood spot is extracted with internal standard. The extract is subjected to liquid chromatography tandem mass spectrometry (LC-MS/MS) analysis. The MS/MS is operated in the multiple reaction monitoring positive mode to follow the precursor to product species transitions for each analyte and internal standard. The ratio of the extracted peak areas to internal standard determined by the LC-MS/MS is used to calculate the concentration of in the sample.(Unpublished Mayo method)

## **PDF Report**

No

## Day(s) Performed

Tuesday

#### Report Available

3 to 9 days

## Specimen Retention Time

Whole blood: 7 days; Dried blood spot: Normal results: 2 months; Abnormal result: Indefinitely

#### **Performing Laboratory Location**

Rochester

#### **Fees & Codes**
