MAYO CLINIC LABORATORIES

Test Definition: LLPB

Leukemia/Lymphoma Immunophenotyping, Flow Cytometry, Blood

Overview

Useful For

Evaluating lymphocytoses of undetermined etiology

Identifying B- and T-cell lymphoproliferative disorders involving blood

Distinguishing acute lymphoblastic leukemia (ALL) from acute myeloid leukemia (AML) using whole blood specimens

Immunologic subtyping of ALL

Distinguishing reactive lymphocytes and lymphoid hyperplasia from malignant lymphoma using whole blood specimens

Distinguishing between malignant lymphoma and acute leukemia using whole blood specimens

Phenotypic subclassification of B- and T-cell chronic lymphoproliferative disorders, including chronic lymphocytic leukemia, mantle cell lymphoma, and hairy cell leukemia

Recognizing AML with minimal morphologic or cytochemical evidence of differentiation

Recognizing monoclonal plasma cells

Reflex Tests

Test Id	Reporting Name	Available Separately	Always Performed
FCINT	Flow Cytometry Interp, 2-8 Markers	No, (Bill Only)	No
FCIMS	Flow Cytometry Interp, 9-15 Markers	No, (Bill Only)	No
FCINS	Flow Cytometry Interp,16 or greater	No, (BIll Only)	No

Additional Tests

Test Id	Reporting Name	Available Separately	Always Performed
FIRST	Flow Cytometry, Cell Surface, First	No, (Bill Only)	Yes
ADD1	Flow Cytometry, Cell Surface, Addl	No, (Bill Only)	Yes

Testing Algorithm

A screening triage panel is initially performed to evaluate for monotypic B cells by kappa and lambda light chain expression, increased numbers of blast cells by CD34 and CD45 expression along with side scatter gating, and increased plasma cells by CD45 expression and side scatter gating. The triage panel also includes antibodies to assess the number of CD3-positive T cells and CD16-positive/CD3-negative natural killer cells present. This triage panel also determines if there is an increase in the number of T cells that aberrantly coexpress CD16, an immunophenotypic feature of T-cell granular lymphocytic leukemia.

If no abnormalities are detected by the initial panel, no further flow cytometric assessment will be performed unless otherwise indicated by specific features of the clinical presentation or prior laboratory results.

The triage screen panel, together with the provided clinical history and morphologic review, is used to determine what, if any, additional marker testing is needed for disease diagnosis or classification. If additional testing is required, it will be added per the algorithm to fully characterize a disease state with a charge per unique antibody tested. Possible additional panels containing specific markers include, but are not limited to, the following: T-cell panel, B-cell panel, acute panel, myeloperoxidase/terminal deoxynucleotidyl transferase (MPO/TdT) panel, killer-cell immunoglobulin-like receptor panel, B-cell acute lymphoblastic leukemia (ALL) panel, plasma cell panel.

Method Name
Immunophenotyping

NY State Available
No

Specimen

Specimen Type
Whole blood

Ordering Guidance
This test is appropriate for hematopoietic peripheral blood specimens only.

For bone marrow specimens, order LLBM / Leukemia/Lymphoma Immunophenotyping by Flow Cytometry, Bone Marrow.

For solid tissue specimens, order LLTS / Leukemia/Lymphoma Immunophenotyping, Flow Cytometry, Tissue.

For body fluid and cerebrospinal fluid specimens, order LLBF / Leukemia/Lymphoma Immunophenotyping, Flow Cytometry, Body Fluid

Shipping Instructions
Specimen must arrive within 96 hours of collection.

Specimen Required

Specimen Type: Whole blood
Container/Tube:
Preferred: Yellow top (ACD solution A or B)
Acceptable: Lavender top (EDTA)
Specimen Volume: 6 mL
Slides: If possible, include 5 to 10 unstained blood smears labeled with **two unique identifiers**
Collection Instructions:
1. Send whole blood specimen in original tube. **Do not aliquot**.
2. Label specimen as blood.

Specimen Minimum Volume

3 mL

Reject Due To

Gross hemolysis	Reject

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Whole blood	Ambient	4 days	

Clinical & Interpretive

Clinical Information

Diagnostic hematopathology has become an increasingly complex subspecialty, particularly with neoplastic disorders of blood and bone marrow. While morphologic assessment of blood smears, bone marrow smears, and tissue sections remains the cornerstone of lymphoma and leukemia diagnosis and classification, immunophenotyping is a very valuable and important complementary tool.

Immunophenotyping hematopoietic specimens can help resolve many differential diagnostic problems posed by the clinical or morphologic features.

Reference Values

An interpretive report will be provided.

This test will be processed as a laboratory consultation. An interpretation of the immunophenotypic findings and correlation with the morphologic features will be provided by a hematopathologist for every case.

Interpretation

Report will include a morphologic description, a summary of the procedure, the percent positivity of selected antigens,

and an interpretive conclusion based on the correlation of the clinical history with the morphologic features and immunophenotypic results.

Cautions

Specimens will be initially triaged to determine which, if any, of the immunophenotyping panels should be performed.

Performance

Method Description

Flow cytometric immunophenotyping of peripheral blood is performed using the following antibodies:
Triage panel: CD3, CD10, CD16, CD19, CD34, CD45 and kappa and lambda surface light chains

Possible additional panels:
-B-cell panel: CD5, CD11c, CD20, CD22, CD23, CD38, CD103, and CD200
-T-cell panel: CD2, CD3, CD4, CD5, CD7, CD8, CD45, TRBC1 and gamma/delta T-cell receptors
-Killer-cell immunoglobulin-like receptor (KIR) panel: CD56, CD57, CD94, CD158a, CD158b, CD158e (p70), and NKG2a

-Acute panel: CD2, CD7, CD13, CD15, CD33, CD36, CD38, CD56, CD64, CD117, and HLA-DR
-B-cell ALL, minimal residual disease (MRD) panel: CD10, CD19, CD20, CD22, CD24, CD34, CD38, CD45, CD58, CD66c
-Myeloperoxidase/terminal deoxynucleotidyl transferase (MPO/TdT) panel: cytoplasmic CD3, CD13, cytoplasmic CD22, CD34, CD45, cytoplasmic CD79a, nuclear TdT, and cytoplasmic MPO
-Plasma cell panel: CD19, CD38, CD45, CD138, and cytoplasmic kappa and lambda light chains
-Sezary Panel: CD2, CD3, CD4, CD5, CD7, CD8, CD26, CD45 and TRBC1

PDF Report
No

Day(s) Performed
Monday through Friday, Sunday

Report Available
1 to 4 days

Specimen Retention Time
14 days

Performing Laboratory Location
Jacksonville

Fees & Codes

Fees
- Authorized users can sign in to Test Prices for detailed fee information.
- Clients without access to Test Prices can contact Customer Service 24 hours a day, seven days a week.
- Prospective clients should contact their account representative. For assistance, contact Customer Service.

Test Classification
This test was developed using an analyte specific reagent. Its performance characteristics were determined by Mayo Clinic in a manner consistent with CLIA requirements. This test has not been cleared or approved by the US Food and Drug Administration.

CPT Code Information
88184-Flow cytometry; first cell surface, cytoplasmic or nuclear marker x 1
88185-Flow cytometry; additional cell surface, cytoplasmic or nuclear marker (each)
88187-Flow Cytometry Interpretation, 2 to 8 Markers (if appropriate)
88188-Flow Cytometry Interpretation, 9 to 15 Markers (if appropriate)
88189-Flow Cytometry Interpretation, 16 or More Markers (if appropriate)
