

Test Definition: UNHB

Hemoglobin Stability, Blood

Overview

Useful For

Work-up of congenital hemolytic anemias

Method Name

Only orderable as part of a profile or as a reflex. For more information see:

- HAEV1 / Hemolytic Anemia Evaluation, Blood
- HBEL1 / Hemoglobin Electrophoresis Evaluation, Blood
- THEV1 / Thalassemia and Hemoglobinopathy Evaluation, Blood and Serum
- REVE2 / Erythrocytosis Evaluation, Blood
- MEV1 / Methemoglobinemia Evaluation, Blood

Isopropanol and Heat Stability

NY State Available

Yes

Specimen

Specimen Type

Whole Blood EDTA

Specimen Required

Only orderable as part of a profile or as a reflex. For more information see:

- HAEV1 / Hemolytic Anemia Evaluation, Blood
- HBEL1 / Hemoglobin Electrophoresis Evaluation, Blood
- THEV1 / Thalassemia and Hemoglobinopathy Evaluation, Blood and Serum
- REVE2 / Erythrocytosis Evaluation, Blood
- MEV1 / Methemoglobinemia Evaluation, Blood

Specimen Minimum Volume

1 mL

Reject Due To

Gross hemolysis	Reject
-----------------	--------

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Whole Blood EDTA	Refrigerated	7 days	

Clinical & Interpretive

Clinical Information

Unstable hemoglobin disease is rare and may be caused by any of a large number of hemoglobin variants. They are inherited as autosomal dominant traits. The severity of the disease varies according to the hemoglobin variant; there may be no clinical symptoms, or the disease may produce a mild, moderate, or severe hemolytic anemia.

The stained peripheral blood smear shows anisocytosis, poikilocytosis, basophilic stippling, polychromasia, and sometimes, hypochromia. The reticulocyte count may be increased. Splenomegaly and Heinz bodies may also be present.

Reference Values

Only orderable as part of a profile or as a reflex. For more information see:

- HAEV1 / Hemolytic Anemia Evaluation, Blood
- HBEL1 / Hemoglobin Electrophoresis Evaluation, Blood
- THEV1 / Thalassemia and Hemoglobinopathy Evaluation, Blood and Serum
- REVE2 / Erythrocytosis Evaluation, Blood
- MEV1 / Methemoglobinemia Evaluation, Blood

Normal (reported as normal [stable] or abnormal [unstable])

Interpretation

An abnormal or unstable result is indicative of a hemoglobin variant present. Other confirmatory tests should be performed to identify the hemoglobinopathy (HBEL1 / Hemoglobin Electrophoresis Cascade, Blood).

Cautions

False-positive results will be obtained in blood specimens containing greater than 5% fetal hemoglobin or in specimens greater than 1 week old.

Performance

Method Description

Unstable hemoglobins precipitate in dilute solutions of isopropanol. Washed erythrocytes are hemolyzed and cleared by centrifugation. Isopropanol is added. The hemolysate is incubated at 37 degrees C for 20 minutes and examined for turbidity. There is no turbidity with normal hemoglobins. (Schmidt RM: Laboratory diagnosis of hemoglobinopathies. PDF Report

No

Day(s) Performed

Monday through Friday

Report Available

1 to 4 days

Specimen Retention Time

30 days

Performing Laboratory Location

Mayo Clinic Laboratories - Rochester Main Campus
